Comet Chemistry
Factor Label Worksheet

On the planet Rigel 12, Rigellians have developed a system of measurements called S.U., or Systems Universal. Here is the conversion table for the measurements of distance:

1 gleem = 27 blops
1 blop = 34 riddigs
1 riddig = 42 chirks
1 chirk = 9 duggles
10 duggles = 52 hippers
2.5 hippers = 1.2 zookas
1 zooka = 7 wenzels
1 wenzel = diameter of 1 larval stage weevip

Use this information to answer the following questions (and of course - **SHOW ALL WORK**).

1. How many gleems in one riddig?
2. If you have 7 gleems, how many blops do you have?
3. How many zookas in one duggle?

4. If you have 7 chirks, how many riddigs do you have?

1 gleem = 27 blops
1 blop = 34 riddigs
1 riddig = 42 chirks
1 chirk = 9 duggles
10 duggles = 52 hipers
2.5 hipers = 1.2 zookas
1 zooka = 7 wenzels
1 wenzel = diameter of
1 larval stage weevip

5. The distance from Rigel 12 to Vulcan is 3,000 gleems. How many chirks is it from Rigel 12 to Vulcan?

6. The size of the Nubus Galaxy is only 2.7×10^9 duggles. How many blops is this?

7. How many larval stage weevips would you have to line up side by side to measure 42 wenzels?

8. Come up with your own conversion question, then solve it.
